数字产品概念方案

一 概念名称：搭载虚拟试穿功能的手机 APP

二 问题描述：顾客前往实体店购物时，常常发现心仪商品缺货。在网购前，他们无法预览衣服上身效果。这种线上线下购物的割裂感，会造成糟糕的客户体验，也让零售商损失销量。顾客可能空手离开门店，转而选择竞品品牌。同时也可能导致品牌口碑下降，用此数字产品概念也是品牌紧跟时代潮流，与时俱进，持久发展善于创新的体现。

三 拟推出的数字化体验：这是一款零售手机 App，主打虚拟试穿（Virtual Try-On）功能。消费者可以利用手机摄像头，虚拟试穿服装和配饰。App 同时对接零售商库存系统，可查询线下门店与线上仓库的库存，弥合线下逛店和线上购买之间的差距。如此既可以解决顾客无法预览上身效果而造成的销量损失，也可以在 AI 时代提升效率与对顾客服务的品质，减少顾客流向竞品，持续提升品牌口碑。

四 工作原理：

1. 顾客在家或者在实体店内打开这款手机 App。
2. 顾客扫描商品吊牌，或者在 App 内挑选商品，启动 Galaxy

AI 虚拟试穿。

3. App 通过手机摄像头，将商品叠加展示在顾客身上。顾客可以看到很还原的版型和颜色搭配。同时 APP 标注面料做工便于顾客挑选与精准购物。

4. 用户查看实时库存：如果当前门店缺货，可以查看周边门店或者线上仓库是否有货。

5. 用户可以在 App 内预约其他门店的商品，或者直接下单网购。使客流与转化率的精准度大幅提升。

6.门店店员可协助顾客操作 App，引导顾客体验 AI 虚拟试穿；借助 App 快速查询全渠道库存，为顾客推荐版型合适的替代商品；登记顾客试穿反馈，同步至系统，及时补货，充分了解顾客需求，为下一季度的选品进货提供思路。同时实时更新数据，优化 AI 推荐模型，形成自己的体系，打造品牌口碑。

五 给顾客带来的价值：

1.随时随地虚拟试衣，不需要反复更换实体衣物，减少了线上线下的购物割裂感。一键查询全渠道库存，避免白跑一趟门店。操作便捷，大幅提升选购效率，优化购物流程，增强顾客对品牌的信任感。

2.根据个人偏好，收到个性化商品推荐。

3.借助 Galaxy AI 虚拟试穿打造新颖的科技购物体验，带来全新的沉浸式参与感，迅速提升对品牌的好感度。

4.在同一个 App 里，无缝切换线下逛货和线上下单。顾客愿意下载并使用 App，还会自发向亲友分享推荐，形成口碑传播。

5.品牌紧跟数字化潮流、与时俱进，让消费者认可品牌的长期发展潜力，更愿意持续消费。

六 带给企业的价值：

在 AI 数字化时代，该应用能够有效提升商品浏览到下单的转化效率，拉动整体销量增长。App 持续沉淀顾客选购、虚拟试穿等行为数据，精准挖掘用户偏好，构建专属 AI 模型库，支撑个性化商品推荐。同时项目助力塑造科技赋能的品牌形象，积累良好品牌口碑；打通线上线下数据闭环，持续增强品牌差异化市场竞争力。

除此之外，方案可降低门店缺货带来的客户流失，留存销售机会；赋能店员高效服务顾客，借助用户自发分享带来新增客流，进一步扩大品牌触达范围。

七 核心功能：

1. Galaxy AI 虚拟试穿功能：顾客可基于手机摄像头实时预览商品上身效果，无需反复试穿，快速挑选适配自己的产品。即使在门店也可以商品品牌扫码识别。

2. 全渠道库存查询功能：支持线下门店、线上仓库实时

查库存，彻底解决缺货白跑，购物割裂问题。

3. AI 智能个性化推荐：根据用户身形、试穿习惯、浏览偏好精准匹配专属商品，提升选购精准度。

4. 店员专属辅助功能：店员可协助顾客操作试穿、查询库存、推荐替代款、收集用户反馈，提升门店服务专业度。

5. 用户数据沉淀与 AI 模型自建：系统长期积累试穿、浏览、消费数据，形成品牌专属用户模型库，让数据越来越精准，提高品牌核心竞争力。

6. 线上线下一体化交易功能：支持店内预留、一键下单，打通线下体验、线上购买的完整闭环。

7. 社交分享传播功能：支持用户自主分享、推荐种草，为品牌带来新客流，自动扩大品牌销量与口碑。

八 潜在挑战

1. 用户信任度不足：多数消费者对 AI 虚拟试穿效果存在顾虑，无法完全信任数字化模拟效果，担心面料质感、真实版型、上身立体度与实物存在偏差。

2. 人群覆盖存在局限：部分传统消费群体、年长顾客不适应智能化购物方式，抵触使用手机 AI 试穿功能，导致产品无法覆盖全部客群。

3. AI 技术体验存在短板：虚拟试穿仅能实现基础视觉模拟，无法还原真实面料垂感、衣物褶皱、贴合松紧度和

真实穿着舒适度，体验存在不可避免的误差。

4. 特殊体型数据覆盖不全：AI 模型数据库无法百分百覆盖全部身高、体型、比例的用户，对特殊身材人群的推荐精准度有限。

5. 流量增长不稳定：新客流与口碑传播依赖用户主动分享，属于被动引流，无法保证持续、稳定的市场覆盖与销量增长。

6. 投入成本高、推广效果不确定：AI 算法搭建、APP 长期运维、市场宣传推广都需要持续高额成本投入。数字化功能上线后，无法保证推广效果百分百达标，存在落地效果不确定性。

7. 商业收益不可控：新型智能体验功能的市场接受度、实际转化效果无法完全预判。可能出现高投入、低回报的情况，无法稳定带来对等的销量与客流增长，存在投资风险。

8.库存数据存在延迟：偶尔会展示错误信息，可能降低顾客信任度。

Mobile App Equipped with Virtual Try-On Function

Ⅰ: Concept Name

Mobile App with Integrated Virtual Try-On Feature

Ⅱ: Problem Description

When customers shop at physical stores, they often find that their desired items are out of stock. Before making online purchases, they are unable to preview how clothing will look on their bodies. This fragmentation between online and offline shopping not only creates a poor customer experience but also causes retailers to lose sales. Customers may leave the store empty-handed and turn to competing brands, which may also lead to a decline in brand reputation. This digital product concept reflects the brand's commitment to keeping pace with the times, advancing with innovation, and achieving long-term sustainable development.

Ⅲ: Proposed Digital Experience

This is a retail mobile App with （Virtual Try-On）as its core

function. Consumers can use their smartphone cameras to virtually try on clothing and accessories. The App is also integrated with the retailer's inventory system, enabling customers to check stock levels across offline stores and online warehouses, bridging the gap between in-store browsing and online purchasing. This solution not only resolves sales losses caused by customers' inability to preview upper-body effects but also enhances operational efficiency and customer service quality in the AI era, reducing customer churn to competitors and continuously improving brand reputation.

Ⅳ: Working Principle

1. Customers open the mobile App either at home or inside a physical store.

2. Customers scan the product tag or select items within the App to activate Galaxy AI Virtual Try-On.

3. The App overlays the selected product onto the customer's body in real time through the smartphone camera, presenting a highly restored display of the garment's silhouette and color matching. Meanwhile, the App clearly marks fabric and craftsmanship details to

facilitate customers' selection and precise shopping decisions.

4. Users view real-time inventory status: if the current store is out of stock, they can check availability in nearby stores or online warehouses.

5. Users can reserve the product at other stores through the App or place an online order directly, significantly improving the accuracy of customer flow and conversion rate.

6. In-store staff can assist customers in operating the App and guide them through the AI virtual try-on experience; they can quickly query omni-channel inventory via the App to recommend alternative items with suitable silhouettes for customers, record customers' try-on feedback which is synchronized to the system to support timely restocking, fully understand customer demands, and provide insights for the next quarter's product selection and procurement. Real-time data updates will also optimize the AI recommendation model, helping the brand build its own systematic operation system and enhance brand reputation.

Ⅴ: Value for Customers

1. Try on clothing virtually anytime, anywhere without repeatedly changing physical garments, eliminating the fragmentation between online and offline shopping. Users can check omni-channel inventory with one click, avoiding unnecessary trips to physical stores. The simple operation significantly improves selection efficiency, optimizes the shopping process, and enhances customers' trust in the brand.

2. Receive personalized product recommendations based on individual preferences.

3. Create an innovative tech-driven shopping experience through Galaxy AI Virtual Try-On, bringing a brand new immersive sense of participation that rapidly boosts customers' goodwill towards the brand.

4. Seamlessly switch between offline product browsing and online ordering within the same App. Customers are willing to download and use the App, and will even spontaneously share and recommend it to friends and relatives, driving word-of-mouth communication.

5. The brand's commitment to digital transformation and progress makes consumers recognize its long-term

development potential, making them more willing to make repeated purchases.

Ⅵ: Value for the Enterprise

In the AI digital era, this application can effectively improve the conversion efficiency from product browsing to order placement, driving overall sales growth. The App continuously accumulates users' selection, virtual try-on and other behavioral data to accurately mine user preferences, build a proprietary AI model library to support personalized product recommendations. Meanwhile, the project helps shape a tech-empowered brand image and accumulate positive brand reputation; it closes the online-offline data loop and continuously enhances the brand's differentiated market competitiveness.

In addition, the solution can reduce customer churn caused by in-store stock shortages and preserve sales opportunities, empower staff to serve customers more efficiently, and attract new customer flow through users' spontaneous sharing, further expanding the brand's reach.

Ⅶ： Core Functions

1. Galaxy AI Virtual Try-On Function: Customers can preview the upper-body effect of products in real time through the smartphone camera, no need to repeatedly try on physical garments to quickly pick items that suit them. Even inside physical stores, users can scan product brand tags for recognition.

2. Omni-Channel Inventory Query Function: Supports real-time stock checking across offline stores and online warehouses, completely solving the problem of wasted trips caused by out-of-stock items and eliminating shopping experience fragmentation.

3. AI Intelligent Personalized Recommendation: Accurately matches exclusive products based on users' body shapes, try-on habits and browsing preferences to improve selection accuracy.

4. Store Staff Exclusive Assistant Function: staff can assist customers with virtual try-on operations, inventory queries, alternative product recommendations and user feedback collection, to enhance the professionalism of in-store services.

5. User Data Accumulation and Self-Built AI Models: The system accumulates try-on, browsing and consumption data over the long term to form a brand-exclusive user model library, making data increasingly accurate and enhancing the brand's core competitiveness.

6. Online-Offline Integrated Transaction Function: Supports in-store product reservation and one-click ordering, closing the complete loop of offline experience and online purchasing.

7. Social Sharing and Communication Function: Allows users to share content independently and support word-of-mouth promotion, bringing new customer flow for the brand and automatically expanding sales and reputation.

Ⅷ: Potential Challenges

1. **Insufficient User Trust:** Most consumers have concerns about the effect of AI virtual try-on, cannot fully trust the digital simulation results, and worry that the fabric texture, real silhouette and three-dimensional wearing effect will deviate from the actual product.

2. **Limited Audience Coverage:** Some traditional consumer groups and elderly customers are not accustomed to intelligent shopping methods and resist using the AI virtual try-on function, resulting in the product being unable to cover all customer groups.
3. **Shortcomings in AI Technology Experience:** Virtual try-on can only realize basic visual simulation, and cannot restore the real fabric drape, garment wrinkles, fit tightness and real wearing comfort, leading to unavoidable deviations in the experience.
4. **Incomplete Coverage of Special Body Types:** The AI model database cannot cover 100% of users with all heights, body shapes and proportions, so the recommendation accuracy for people with special body types is limited.
5. **Unstable Traffic Growth:** New customer flow and word-of-mouth promotion rely on users' active sharing, which belongs to passive drainage and cannot guarantee sustained and stable market coverage and sales growth.
6. **High Investment Cost and Uncertain Promotion Effect:** AI algorithm construction, long-term App operation and maintenance, and marketing promotion all

require continuous high capital investment. After the digital function is launched, it cannot be guaranteed that the promotion effect will fully meet expectations, leading to uncertainties in implementation outcomes.

7. **Uncontrollable Commercial Returns:** The market acceptance and actual conversion effect of the new intelligent experience function cannot be fully predicted. There is a risk of high input with low returns, which may fail to bring corresponding stable growth in sales and customer flow, resulting in investment risks.
8. **Inventory Data Delay:** Occasional display of incorrect information may reduce customers' trust in the brand
